## Introduction

Histone N-terminal tails are central to the processes that form and modulate nucleosome structure and function.

## Description

Post-translational modifications of histones play a key role in the regulation of gene access in eukaryotes. The majority of these modifications occur in the N-terminal tails of the histones in the form of methylation, acetylation or phosphorylation of amino-acid residues

# Application

Pull/down assays, protein interactions, post-translational modifications.

## **Purification method**

Affinity chromatography

## Formulation

Supplied as frozen liquid, 1 mg/ml.

## Specificity

N/A

## Storage

-80C

Analyte specific reagent (ASR) manufactured under ISO 13485. Country of origin: Czech Republic
